

- What has been working?

I am pleased with the progress of the outline of our concept of the project topic. I believe what has been working is our structure of code being laid out and more or less set in stone. This allows us to be able to work on the code within each function that we need, since we have all the functions set up. We were also able to figure out how we wanted the user menu display to look like and what the selection should be. This allows us to get a good general idea of what this should look like overall, and where to fill in code. The organization and comments/docstrings within the code also help us keep on track which has been working.

- What has not been working?

For some reason the importing of pandas has been giving us a bit of a problem. We are still working on filling in the code for each of the functions so we are not too sure yet of what specifically of what doesn't work, but as we progress I'm sure we will come across errors and will know specifically what is not working.

- What can you do differently to address what hasn't been working?

We have yet to reach out to a TA for any of our problems such as the importing of pandas not being able to import properly. The thing we could do differently to address this issue would be to actually reach out to a TA for help or even the professor.
