

- What has been working?

We have successfully completed our functions of `def year`, `def most_revenue`, `def topRated_movies`, `def leastRated_movies`, `def movie_genre`, `def show_user_menu`, etc. Being able to import the data from the excel file has been successful and we have been able to correctly assert the correct movies for each top 10 scenario.

- What has not been working?

We have been needing more attention to the `def genre_type` and we need to create a while True conditional statement or a if else statement that would allow the user to pick a genre option and it would print out the top 10 movies from that selected genre. That might be the only thing “not working” at this moment but it’s still a work in progress.

- What can you do differently to address what hasn't been working?

We could reach out to a TA or the professor to help address some issues that might arise as we continue to work on our project.
